

presentation sections	weight	summary	criterion	excellent	Pass
1. aims, significance and engineering context	15%	aims and purpose	Have they been able to explain what the goal of their project is, why it is important and how their solution meets the need in question.	The presentation should explain the nature of the problem that the project is addressing using key targeted references. It should clearly state what the nature of the technical issues that are being dealt with are, both within the context of the subject matter and from an engineering point of view. Stakeholders should be identified clearly in terms of who will benefit from the outcome of the project and any legal or societal constraints should be explained. The intended outcome of the project should be made clear and its potential impact evaluated	The nature of the problem should be stated and the outcome clear. No references provided and no broader discussion of issues
2. previous work in area	10%	use of literature	How well have they used literature data sheets etc to decide how to solve their problem	All areas of the presentation are appropriately justified using literature sources, including papers and data sheets. These should be listed at the end using a standard referencing style such as Harvard or IEEE. Relevant work in the area is summarised. The discussion of any results should refer to relevant literature.	Relevant literature is listed and described briefly. It may only be in a literature review section.
3. overview of design solution 4. methods and their justification	20%	technical aspects of solution design	In the design of their solution how well have they applied appropriate maths, science and/or engineering principles, have they looked at the problem as a whole or just in parts, how carefully and well have they chosen the hardware, software etc in the	The overall approach to the projects aims should be described using appropriate systems diagrams and flow charts. These should make clear how the activities involved in the project relate to the outside world in terms of inputs and outputs. Where appropriate relevant references should be used to justify	A basic overview of the project is presented with little detail. Some theory relevant to the project is explained. Components and

			solution of their problem and have they justified the choices	the approach. The key science and engineering ideas underpinning the project should be explained, focussing on what is needed to understand the design, methods and the analysis of its results. The methods used should be explained, including, any equipment, components, coding techniques etc. Also experimental and testing processes should be justified.	method used stated but with little detail or justification.
5. results and progress to date 6. discussion of results	20%	practical skills and tangible deliverables	how well have they executed what they have done so far and how much have they achieved given the date of the presentation (tangible deliverables)	Initial project results should be presented which demonstrate the development of hardware, software, modelling or other appropriate technical deliverables and initial testing results. The results should be commented on and conclusions drawn as to the next steps in the project. The amount of results and analysis should be consistent with working on the project full time since the end of the exam period.	designs and prototypes of hardware or software or trial modelling results should be presented.
7. management and plan going forward	15%	project management	how well have the managed their project so far and in their planning going forward.	A gantt chart is presented which is clear but carefully planned (not just a staircase unless appropriate). Milestones and deliverables are clearly listed and justified with explanation. The plan is reflected upon in terms of achievability.	a gantt chart is presented
8. use of feedback on project plan	10%	use of feedback	How have they used the feedback on their project plan	feedback on the project plan is summarised and how it has influenced project planning in any area discussed in some detail	feedback on the project plan is described
Overall and 9. conclusion	10%	communication skills	what is the quality of their presentation and ability to answer questions	All areas of the presentation should be covered concisely and clearly using well designed slides. The slides should be easy to read and	The slides should cover each of the required areas and the student

				understand and be presented in a logical order. The conclusion should be a concise but complete summarise what has been completed so far and what still needs to be achieved The student should give considered answers to questions clearly and reflect upon the project progress as a result.	should be able to answer questions. There should be a conclusion..
	-5%	ethics	Is their ethical assessment adequate deduct 5% for no		
	-5%	risk assessment	Is their risk assessment adequate deduct 5% for no
